ANNEALING

2

- **Solution 2:** Keep the reference fixed and modify the target

- Given a divergence D and a reference η and target π

$$\eta \xrightarrow{D(\pi||\eta)} \pi$$

- We can then efficiently propogate inference from π_1 to π_2 close to π_1

$$\pi_0 = \eta \xrightarrow{D(\pi_1 \| \pi_0)} \pi_1 \xrightarrow{D(\pi_2 \| \pi_1)} \pi_2$$

- We can effieciently propagate inferences from $\eta = \pi_0$ to π_1 if $D(\pi_1 \| \pi_0)$ is small

$$\pi_0 = \eta \xrightarrow{D(\pi_1 \| \pi_0)} \pi_1$$

- Can repeat until we reach the target

$$\pi_0 = \eta \xrightarrow{D(\pi_1 \| \pi_0)} \pi_1 \xrightarrow{D(\pi_2 \| \pi_1)} \pi_2 \quad \ldots \quad \pi_{N-1} \xrightarrow{D(\pi_N \| \pi_{N-1})} \pi_N = \pi$$

ANNEALING

- Given a divergence D and a reference η and target π

$$\eta \xrightarrow{\qquad\qquad\qquad D(\pi||\eta) \qquad\qquad\qquad} \pi$$

- **Solution 2:** Keep the reference fixed and modify the target

  - We can effieciently propagate inferences from $\eta = \pi_0$ to π_1 if $D(\pi_1||\pi_0)$ is small

$$\pi_0 = \eta \xrightarrow{D(\pi_1||\pi_0)} \pi_1$$

  - We can then efficiently propogate inference from π_1 to π_2 close to π_1
