

► For $\beta \in [0, 1]$ suppose we have distributions π_β such that $\pi_0 = \eta$ and $\pi_1 = \pi$

► π_β is the annealing distribution corresponding to the annealing parameter β

Target

β

Reference

► Where $\mathcal{B} = \beta_{0:N}$ is the **annealing schedule** satisfying:

$$0 = \beta_0 < \beta_1 < \dots < \beta_N = 1$$

- Transform a d -dimensional multi-modal target into a $d + 1$ -dimensional unimodal one

ANNEALING

3

- ▶ For $\beta \in [0,1]$ suppose we have distributions π_β such that $\pi_0 = \eta$ and $\pi_1 = \pi$
 - ▶ π_β is the **annealing distribution** corresponding to the **annealing parameter** β
 - ▶ Where $\mathcal{B} = \beta_{0:N}$ is the **annealing schedule** satisfying:

$$0 = \beta_0 < \beta_1 < \dots < \beta_N = 1$$

- ▶ Transform a d -dimensional multi-modal target into a $d + 1$ -dimensional unimodal one

HOW TO CONSTRUCT AN ANNEALING PATH
