

SCALING LIMIT (REVERSIBLE)

► **Theorem:** Scaling the index by N and time by N^2 the scaled index process for reversible PT weakly converge to a diffusion independent of target, reference, or annealing path.

► As N grows large, noise from diffusivity dominates

► When N is large, modifying reference, target, or path leads to marginal gains

▶ The scaling limit is independent of choices for P_T

SCALING LIMIT (REVERSIBLE)

- ▶ **Theorem:** Scaling the index by N and time by N^2 the scaled index process for reversible PT weakly converge to a diffusion independent of target, reference, or annealing path.

- ▶ As N grows large, noise from diffusivity dominates
- ▶ The scaling limit is independent of design choices for PT
 - ▶ When N is large, modifying reference, target, or path leads to marginal gains

SCALING LIMIT (NON-REVERSIBLE)
