

ANNEX A ALLING ALGORITHMS

Target

β

Reference

► **Input:** An annealing path π_β + a local efficient inference algorithm for each π_β

Annealing algorithm draws inference from the entire path not just the target

► **Output:** a globally efficient inference algorithm for the path $\beta \mapsto \pi_\beta$

They achieve state-of-the-art performance for hard and mult-modal distribution

▶ Annealing algorithms are meta algorithms:

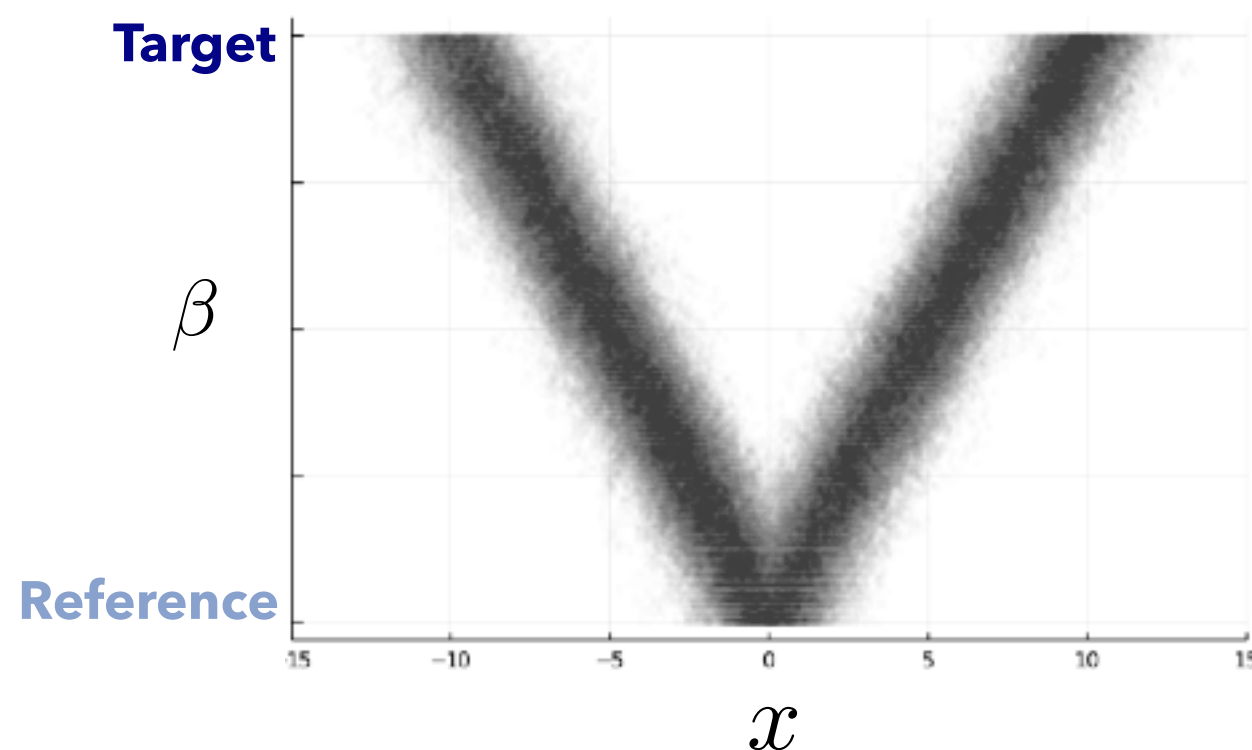

► Can use the reference to assess the quality and ensure robustness

▶ Annealing is not an algorithm but a platform to build algorithms on top of

ANNEALING ALGORITHMS
