NON-REVERSIBLE (OKABE ET AL, 2001)

$$\mathbf{K}_{\text{comm},t} = \mathbf{K}_{\text{even}} 1(t \equiv 0 \bmod 2) + \mathbf{K}_{\text{odd}} 1(t \equiv 1 \bmod 2)$$

$$= \prod_{n \equiv t \pmod{2}} K^{(n, n+1)}$$

Non-reversible P^T trajectory has no invariant!

- If swap for machine m is accepted

$$\epsilon_{t+1}^m = \epsilon_t^m$$

► Otherwise

$$\epsilon_{t+1}^m = -\epsilon_t^m$$

NON-REVERSIBLE PT (OKABE ET AL, 2001)

- Deterministically alternate between **Odd** and **Even** swaps

$$\mathbf{K}_{\text{comm},t} = \mathbf{K}_{\text{even}} 1(t \equiv 0 \pmod{2}) + \mathbf{K}_{\text{odd}} 1(t \equiv 1 \pmod{2})$$

$$= \prod_{n \equiv t \pmod{2}} \mathbf{K}^{(n,n+1)}$$

- Non-reversible PT trajectories have momentum!

- If swap for machine m is accepted

$$\epsilon_{t+1}^m = \epsilon_t^m$$

- Otherwise

$$\epsilon_{t+1}^m = -\epsilon_t^m$$
